-!- FUNCTION: MAY HAVE AN IMPORTANT ROLE IN PRESYNAPTIC FUNCTION. MAY
BE INVOLVED IN CALCIUM-DEPENDENT NEUROTRANSMITTER RELEASE AT NERVE
                                                                                                                                                                                                                                                                  ENDINGS.
--- SUBGNIT: HOMODIMER (PROBABLE).
--- SUBCELLULAR LOCATION: Membrane-bound.
--- TISSUE SPECIFICITY: BRAIN. PREDOMINANTLY ASSOCIATED WITH NERVE
ENDINGS AND SYNAPTIC VESICLES.
--- PTM: FATTY ACYLATED. HEAVILY PALMITOYLATED IN THE CYSTEINE STRING
                                                                                                                      "Cysteine string protein, a DnaJ family member, is present on diverse secretory vesicles.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             01-APR-1993 (Rel. 25, Created)

-!- FUNCTION: INHIBITS SIGNAL TRANSDUCTION BY INCREASING THE GTPASE ACTIVITY OF G PROTEIN ALPHA SUBUNITS THEREBY DRIVING THEM INTO THEIR INACTIVE GBD-BOUND FORM.

-!- SUBCELLULAR LOCATION: Membrane-bound (Potential).

-!- PTM: FATYA ACVLATED. HEAVILY PALMITOYLATED IN THE CYSTEINE STRING MOTIF (BY SIMILARITY).

-!- SIMILARITY: CONTAINS 1 RGS DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SEQUENCE FROM N.A.

J. Biol. Chem. 275:3990-39095(2000).

INTELEMENTAL SIGNAL TRANSDUCTION BY INCREASING THE GTPASE ACTIVITY OF G PROTEIN ALPHA SUBUNITS THEREBY DRIVING THEM INTO THEIR INACTIVE GDP-BOUND FORM. BINDS TO G-ALPHA SUBFAMILY I MEMBERS, WITH THE ORDER G(I)A3 > G(I)A1 > G(O)A >> G(2)A/G(1)A2.

ACTIVITY ON G(2) ALPHA IS INHIBITED BY PHOSPHORYLATION AND PALMITOYLATION OF THE G-PROTEIN.

SUBUNIT: INVERSACTS WITH GIPC PD2 DOMAIN.

SUBCELLULAR LOCATION: Membrane-bound.

TISSUE SPECIFICITY: HICHEST EXPRESSION IN LUNG. PLACENTA, LIVER AND HEART ALSO EXPRESS HIGH LEVELS OF GAIP.
                                                                                                                                                                                                                  PHOSPHORYLATION OF SER-151, AND MUTAGENESIS OF SER-151.

0
AND CSP3/CSP29; ARE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICITY: EXPRESSED IN WIDE RANGE OF SYRAPTIC TERMINALS:
EMBRYONIC NERVOUS SYSTEM, LARVAL NEUROMUSCULAR JUNCTIONS, ADULT
VISUAL SYSTEM (NEUROPIL OF OPTIC GANGLIA AND TERMINAL OF R1-8
PHOTORECEPTORS) AND THORACIC NEUROMUSCULAR JUNCTIONS. ALSO
EXPRESSED IN NOW NEURONAL CELLS: FOLLICLE CELLS, SPERMATHECA,
TESTIS AND EJACULATORY BULB. LOW LEVEL OF EXPRESSION IS FOUND IN
MANY NEURONAL AND NON-NEURONAL TISSUES.
                                                                                                   PTM: FATTY ACYLATED. HEAVILY PALMITOYLATED IN THE CYSTEINE STRING

The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this small. The alpha-conotoxins can be used as neuronsoular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic
as neuromuscular blocking agents for use in surgery and for

alpha-conotoxin polypeptides derived from the venom of cone snails useful e.g. as neuromuscular blocking agents for use in surgery and for useful e.g. as neuromuscular treating unipolar depression

Claim 39; Page 64; 229pp; English.

The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this snail. The alpha-conotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, uninary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.

The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this small. The alpha-conotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, urinary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 alpha-conotoxin polypeptides derived from the venom of cone snalls useful e.g. as neuromuscular blocking agents for use in surgery and for treating unipolar depression - \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give here defined conformations, a rarity in molecules this snail. The alpha-conotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic actylcholine receptors, including cardiovascular disorders, gastric motility disorders, uninary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              alpha-conotoxin polypeptides derived from the venom of cone snails useful e.g. as neuromuscular blocking agents for use in surgery and for treating unipolar depression -

```
and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this small. The alpha-conotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, uninary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails,

The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give hard necrotoxins a rarity in molecules this small. The alpha-conotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, uninary incontinence, nicotinence, nicotinence, nicotinence, also as bipolar disorders, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.
                                                                                                                                     alpha-conotoxin polypeptides derived from the venom of cone snails useful e.g. as neuromuscular blocking agents for use in surgery and for treating unipolar depression -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cone snail; alpha-conotoxin; venom; disulphide bond; mood disorder; neuronal nicotinic acetylcholine receptor; cardiovascular disorder; gastric motility disorder; urinary incontinence; nicotine addiction;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 41;

The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this small. The alpha-conotoxins can be used as neuronamesular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, uninary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma. The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snall. These peptides are found in minute quantities in the venom of the snalls, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this small. The alpha-conotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, unimary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         derived from the venom of cone snails blocking agents for use in surgery and for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give her defined conformations, a rarity in molecules this small. The alpha-conotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, uninary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  alpha-conotoxin polypeptides derived from the venom of cone snails useful e.g. as neuromuscular blocking agents for use in surgery and for treating unipolar depression -

alpha-conotoxin polypeptides derived from the venom of cone snails useful e.g. as neuromuscular blocking agents for use in surgery and for treating unipolar depression -

Claim 39; Page 39; 229pp; English,

The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give them defined conformations, a rarity in molecules this snail. The alpha-conotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, unitary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.

FUNCTION: PHOSPHORYLASE IS AN IMPORTANT ALLOSTERIC ENZYME IN CARBOHYDRATE METABOLISM: ENZYMES FROM DIFFERENT SOURCES DIFFER IN THEIR REGULATORY MECHANISMS AND IN THEIR NATURAL SUBSTRATES. HOWEVER, ALL KNOWN PHOSPHORYLASES SHARE CATALYTIC AND STRUCTURAL PROPERTIES (BY SIMILARITY).
 -!- SUBUNIT: THE TWO CHAINS ARE FORMED FROM A SINGLE-CHAIN PRECURSOR BY THE EXCISION OF TWO ARG RESIDUES AND ARE HELD TOGETHER BY 1 OR
 Gaps
 Thromb. Res. 85:503-514 (1997).
-!- FUNCTION: FACTOR XA IS A VITAMIN K-DEPENDENT GLYCOPROTEIN THAT CONVERTS PROTHROWBIN TO THROMBIN IN THE PRESENCE OF FACTOR VA, CA++, AND PHOSPHOLIPID DURING BLOOD CLOTTING.
-!- CATALYTIC ACTIVITY: Preferential cleavage: Arg-|-Thr and then Arg-|-Ile bonds in prothrombin to form thrombin.

 J. BIOL. Chem. 273:29210-29217(1998).

-!- FUNCATION: TRANSCRIPTIONAL ACTIVATOR. BINDS TO THE INTERFERON-STIMULATED RESPONSE ELEMENT (ISRE) IN IFN PROMOTERS AND IN THE Q PROMOTER (QP) OF EBW NUCLEAR ANTIGEN-1 (EBNA1).

-!- SUBCELLULAR LOCATION: Nuclear (Potential).

-!- ALTERNATIVE PRODUCTS: 4 ISOFORMS; A (SHOWN HERE), B/BETA, C/GAMMA AND D/H; ARE PRODUCED BY ALTERNATIVE SPLICING.

-!- TISSUE SPECIFICITY: EXPRESSED PREDOMINANTLY IN SPLEEN, THYMUS, AND PERIPHERAL BLOOD LEUKOCYTES.

 LARGE SUBUNIT (BY SIMILARITY).

1 SUBCELLULAR LOCATION: LYSOSOMAL AND CYTOPLASMIC.

1 ALTERNATIVE PRODUCTS: TWO ISOFORMS; LYSOSOMAL ISOFORM (SHOWN HERE)

AND CYTOSOLIC ISOFORM; ARE PRODUCED BY ALTERNATIVE SPLICING.

1 TISSUE SPECIFICITY: THE LYSOSOMAL ISOFORM IS WIDERLY EXPRESSED. THE

CYTOSOLIC ISOFORM SHOWS A MORE RESTRICTED DISTRIBUTION WITH

HIGHEST EXPRESSION IN BRAIN AND OVARY AND LOWER LEVELS IN LIVER
 Gaps
 -!- DEVELOPMENTAL STAGE: EXPRESSED IN MATURE B-CELL LINES BUT NOT IN LESS MATURE LINES.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give hem defined conformations, a rarity in molecules this snail. The alpha-conotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, uninary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.

 Alpha-conotoxins MII and U002 have a lower affinity for neuromuscular receptors, than to nicotinic neuronal receptors. This makes them useful for targetted treatment of small cell lung carcinoma (SCLC), as cells of this carcinoma express cholinergic nicotinic receptors. The peptides are administered intravenously or intramuscularly at a preferred dose of 500 nmoles. When labelled (e.g. with radioactive iodine), MII and U002 can be used for detecting SCLC tumours.

AAW12726-W12769 represent conotoxin peptides. This sequence represents the U002 alpha-conotoxin peptide isolated from Conus imperialis. These sequences are identified using the method of the invention. The method of the invention. The method of the invention. The method of the invention is for identifying DNA encoding A-lineage conotoxin peptides by subjecting Conus nucleic acid to amplification with primer sequences (see AAT59718). The primers are specific for the signal sequence and 3'-untranslated (3'UTR) regions of the conotoxin gene, which are highly homologous between conotoxins, and are therefore suitable sites for detection. A-lineage conotoxins include alphaconotoxins, and kappa-conotoxins. Alpha-conotoxins include alphaconotoxins, and kappa-conotoxins. Alpha-conotoxins include alphaconotoxins of synaptic transmission at the neuromuscular junction, and are usually nicotinic acetylcholine receptor blockers. Rappa-conotoxins care usually nicotinic acetylcholine receptor blockers. Rappa-conotoxins dentified can be used as muscle relaxants, in the diagnosis of mysthenia gravis, and for the treatment or diagnosis of small cell lung cancer, the conotoxin peptides act by binding to the nicotinic receptors, and thereby blocking the nicotine-france of the mitogen

The present sequence represents a specifically claimed example of an alpha-conotoxin, which can be used to treat disorders regulated at meuronal nicotinic acetylcholine receptors (nach). The alpha-conotoxins are useful for preparing a pharmaceutical composition for treating disorders regulated at neuronal nAChR, especially alpha 3 beta 2, alpha 3 beta 4 or alpha 7-containing nAChR. Disorders that can be treated include cardiovascular disorders, a gastric motility disorder, urinary incontinence, nicotine addiction, a mood disorder or small cell lung carcinoma. Mood disorders include bipolar disorder, unipolar
 depression, dysthymia and seasonal effective disorder. The alpha-conoctoxins can also be used for diagnosis of small cell lung carcinoma. The alpha-conotoxin antagonists are able to discriminate between non-symmetrical ligand binding interfaces present on the nAChR. The alpha-conotoxin has the ability to potently block any receptor containing a alpha beta subunit interface, regardless of what other subunits may be present in the receptor complex.

 This sequence represents the conotoxin peptide ImI. This sequence and the MII conotoxin peptide (see AAW57903) can be used in the method of the invention for the treatment of a patient who has an altered heart rate or an altered blood pressure. The peptides are found in the venom of marine snails of the genus Conus. They are active as nicotinic acctylcholine receptor antagonists. They differentially block the B and C neurones, and are thus able to differentially block sympathetic impulses to the heart affecting the heart rate and blood pressure. The above agents are capable of discretely affecting the heart rate or blood pressure, without affecting other muscles.

The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidy! and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide components to form a peptidase stabilised therapeutic peptide components to form a close to modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uprake and interference with physiological processes. AMBORS to AmboRS AMBORS TO
 Modifying and attaching therapeutic peptides to albumin prevents peptidase degradation, useful for increasing length of in vivo activity

```
The present invention relates to a number of alpha-conotoxin peptides and their coding sequences from a number of different species of cone snail. These peptides are found in minute quantities in the venom of the snails, and are targeted at the neuronal nicotinic acetylcholine receptors of the nervous system. They usually contain two disulphide bonds, which give here defined conformations, a rarity in molecules this small. The alpha-conotoxins can be used as neuromuscular blocking agents in surgery, and for treating disorders regulated at the neuronal nicotinic acetylcholine receptors, including cardiovascular disorders, gastric motility disorders, uninary incontinence, nicotine addiction, mood disorders such as bipolar disorder, unipolar depression, dysthymia and seasonal affective disorder, and small cell lung carcinoma.

INTIBITY THEM NICOTINIC ACETYLCHOLINE RECEPTORS (NACHR) AND THUS

INTIBITY THEM. IT IS HIGHLY ACTIVE AGAINST THE NEUROMUSCULAR

RECEPTOR IN FROG BUT NOT IN MICE. IN CONTRAST, IT INDUCES SEIZURES
WHEN INNECTED CENTRALLY IN MICE AND RATS. IT TARGET NEURONAL

NACHRS IN MAMMALS. BLOCKS HOMOMERIC ALPHA-7 NICOTINIC RECEPTORS
WITH THE HIGHEST APPARENT AFFINITY AND HOMOMERIC ALPHA-9 RECEPTORS
WITH THE HIGHEST APPARENT AFFINITY. HAS NO EFFECT ON RECEPTORS COMPOSED OF
ALPHA-2/BETA-2, ALPHA-4/BETA-2, ALPHA-4/BETA-2, ALPHA-2/BETA-4,
C. ALPHA-3/BETA-4, OR ALPHA-4/BETA-4, ALPHA-4/BETA-4, ALPHA-4/BETA-4, CMBINATIONS.

-!- SIMILARITY: BELONGS TO THE ALPHA-TYPE CONOTOXIN FAMILY.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
